

An End-to-End framework for AI workflow automation

➔ <https://leetbeed.tk>

Rajesh Y
y.rajesh.4683@gmail.com

Vision Framework

- ▶ Create a vision model on custom datasets
- ▶ Can support of up to 10 unique classes
- ▶ You can upload up to 1000 images with 100 images per class
- ▶ Uses ResNet-50 and transfer-learning on AWS EC2 instances for training custom models
- ▶ Single-click deployment of trained models on AWS LAMBDA

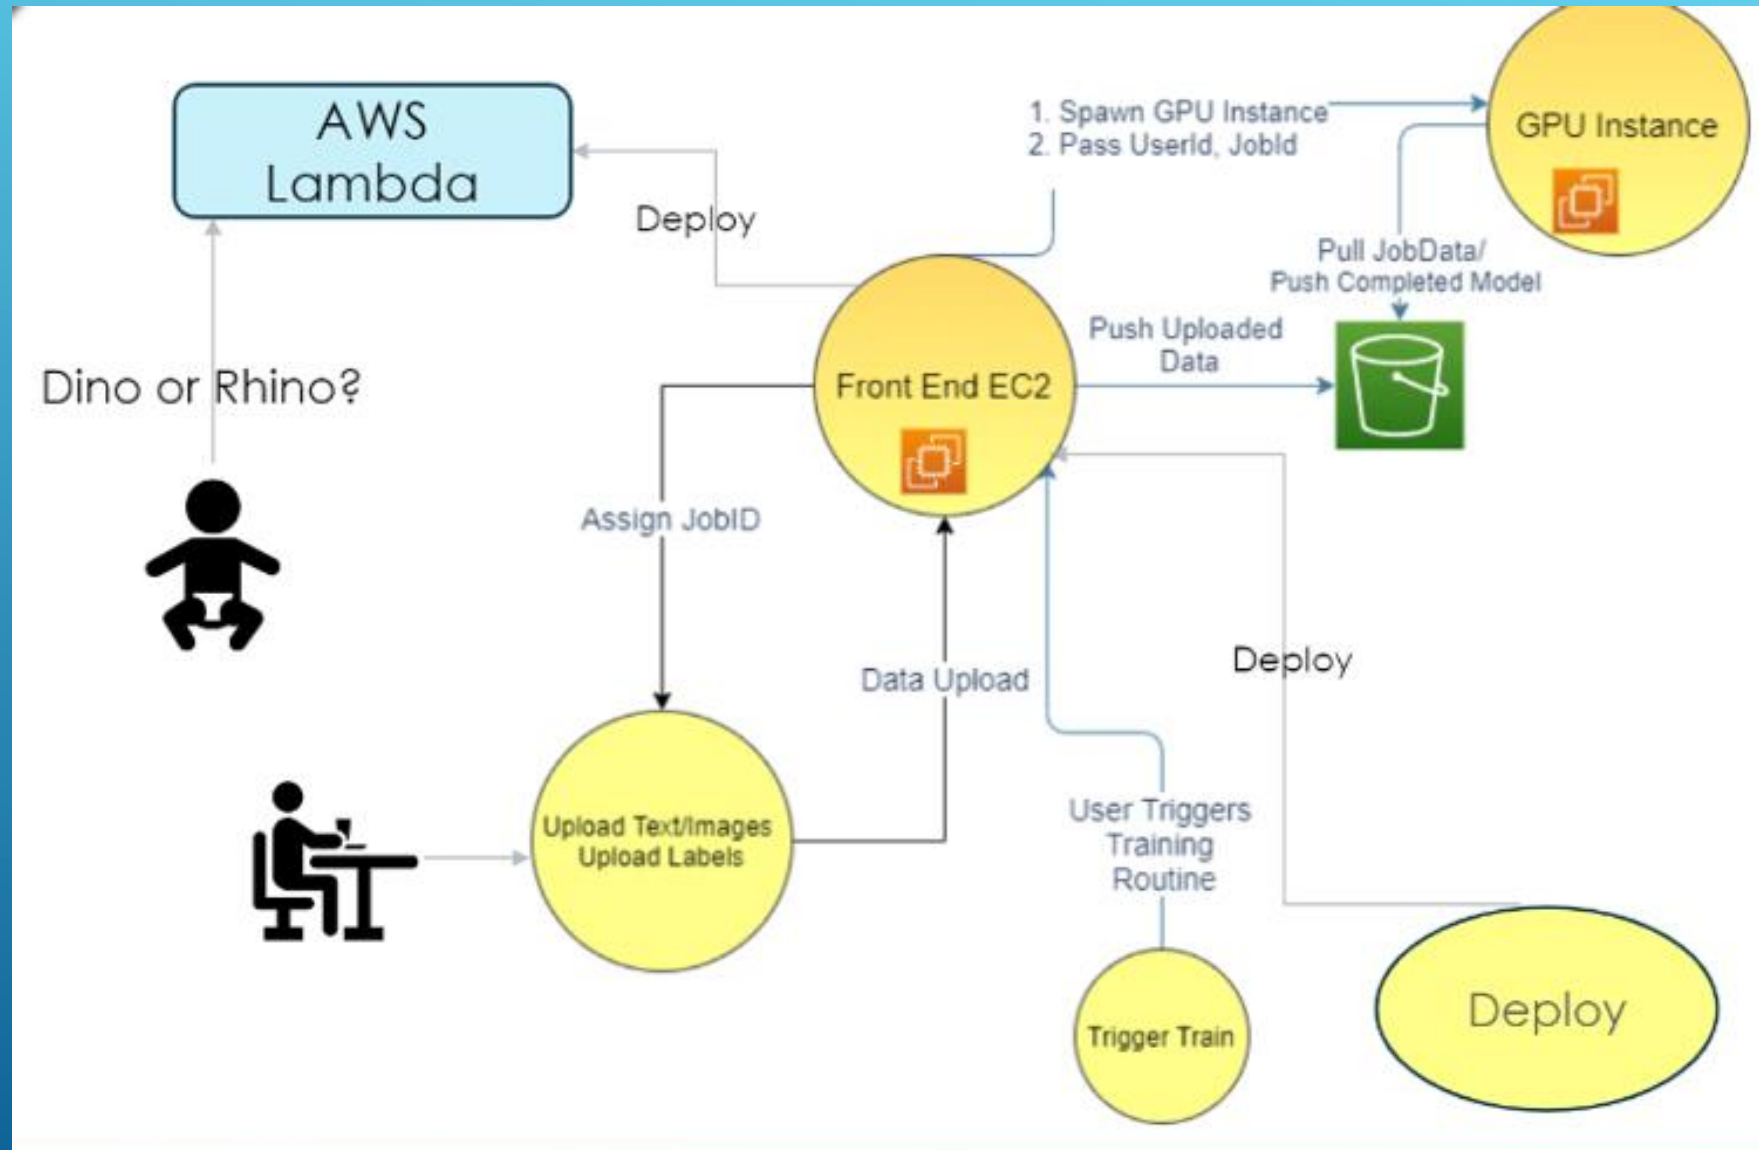

Text/NLP Framework

- ▶ Create a sentiment/text classifier directly from csv file
- ▶ Supports multi-class labels.
- ▶ Uses 2-layer LSTM to train on backend AWS EC2 instances.
- ▶ Single-click deployment of trained models on AWS LAMBDA

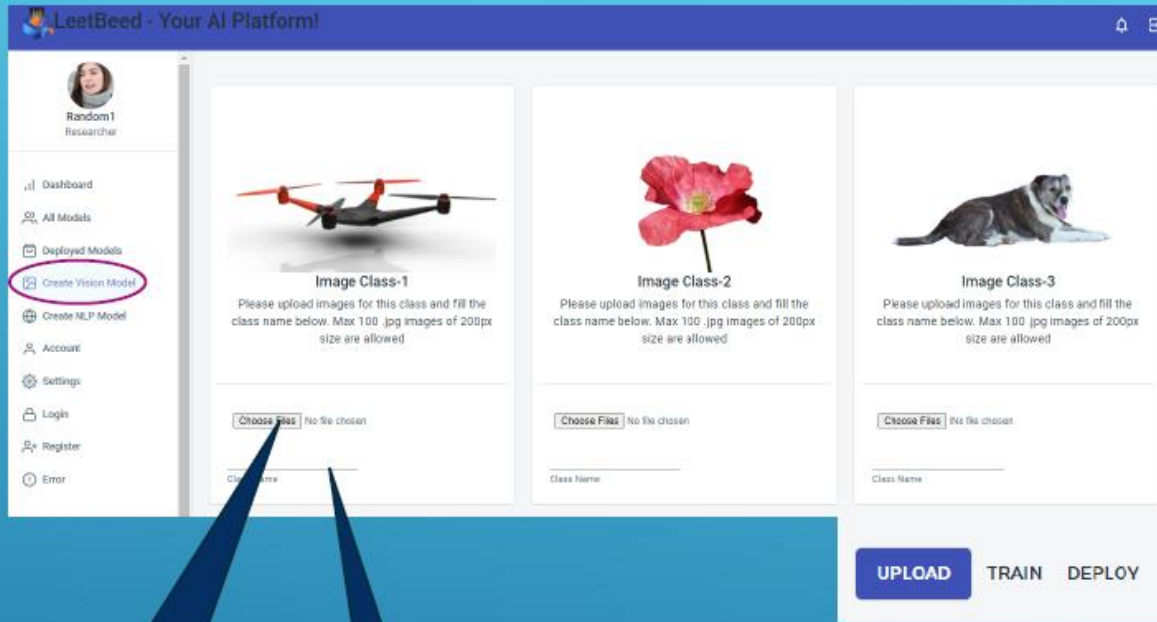

WHAT IS LEETBEED?

Build and deploy Vision/Text
Model in less than 10mins!

LeeTBeed Platform Architecture

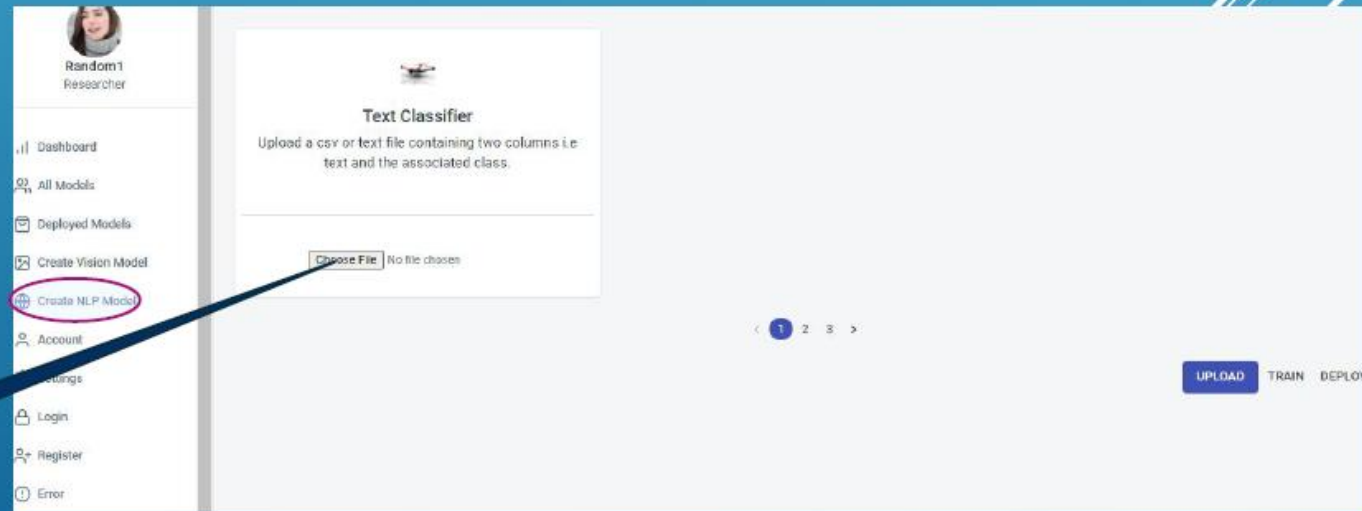

LeeTBeed New Model Creation Pages

Select your image files

Enter corresponding class name

- A new “job” is created once you select your files and click on “Upload”
- The selected files are pushed to AWS S3 bucket by the backend.
- Once data is uploaded → Train → Deploy

Upload a csv file

LeetBeed Deployed Model – Test and Verify your Deployed Models

The screenshot displays the LeetBeed AI Platform interface. The top header is blue with the text "LeetBeed - Your AI Platform!" and a user profile icon. The left sidebar contains navigation links: Dashboard, All Models, Deployed Models (highlighted with a red circle), Create Vision Model, Create NLP Model, Account, Settings, Login, Register, and Error. The main content area shows a grid of six deployed models. Each model card includes a title, a class names input field, a text data input field, a "TEST" button, and a "Choose Files" button. The models are:

- NLP Model 1e56004031
- NLP Model 143f20230d
- Vision Model 24c9720550
- Vision Model 1402de0bf3
- NLP Model a1570703ca
- Vision Model 2c662c3985

At the bottom of the grid, there is a pagination bar with the number 1 highlighted, and a "REFRESH" button in the bottom right corner.

- All the deployed models appear on this page.
- For vision models, select an image and click on Test.
- For NLP models, a direct text input can be provided.
- First attempt is delayed because of AWS Lambda cold start problems

<input type="checkbox"/>	a1570703ca	TXT	10/01/2021	50.5208	Upload Completed	Training completed	Deployment completed
<input type="checkbox"/>	2c662c3985	IMG	06/01/2021	73.3333	Upload Completed	Training completed	Deployment completed

Rows per page: 10 1-6 of 6

- Check your model's current status i.e. Training Status, deployment status
- This screen also allows to Bulk Train/Deploy your models by selecting the respective checkboxes and clicking on Train/Deploy respectively

LeetBeed Dashboard – Bird's Eye View of your Models

Tools and Framework Details

- ReactJS based front-end served from AWS CloudFront to support HTTPS.
- Django/NGINX for backend servers to manage user requests
- Django-Q to manage multiple long running jobs such as:
 - Interaction with S3
 - Booting and triggering training on GPU instances
 - LAMBDA deployments via Serverless
- Pretrained ResNet-50 was used as the base model with head modified based on the input classes. Transfer learning with fine-tuning of last 2 layers for 5 epochs is used.
- For language models, 2 layer LSTM was used.
- All the models are trained on EC2 instances of G4dn.xlarge family.

Challenges and Further Scope

- Barebones LSTM model to be replaced by “Simple Transformers” model
- Faster data sharing mechanism using AWS EFS volume for sharing training data
- OpenAPI support with HTTPS to facilitate ease-of-integration
- RBAC, enhanced security and log management.
